

SMILA Connector for Microsoft SharePoint

Make critical Information out of Microsoft SharePoint available for your Business!

The SMILA Connector for Microsoft SharePoint provides an interface that allows the extraction of vital information out of Windows SharePoint Services 3.0 or Microsoft Office SharePoint Server 2007.

Concentrate on your Business!

The connector allows you to extract all critical information out of SharePoint including security information giving you the ability to concentrate on your information management project. Web Services are included to provide features such as secure search to your customers.

Configure your vital Information

Information that should be extracted from Microsoft SharePoint is highly configurable. Just configure important sites and lists; the information extraction is done for you. Important properties could be defined on content type level. Preconfigurations that meet usual requirements are shipped with the connector.

High Performance and Scalability

High performance and scalability is a major design goal for the connector giving you a high performance integration to your information technology. Delta indexing support is just one of the aspects that helps you to bring a high performance solution to your customer.

Get Information out of Microsoft SharePoint
